Gene (1996) 183:77-85
Conservation of function and expression of unc-119 from two
Caenorhabditis species despite divergence of non-coding
DNA.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 22.125; Variance 25.762; scale 0.859

Statistics:

LIKELY RESULT IN ACCELERATED NEURONAL APOPTOSIS.

-!- DISBASE. DEFECTS IN HAD ARE THE CAUSE OF HUNTINGTON'S DISEASE, AN
AUTOSOWAL DOMINANT NEURODEGENERATIVE DISORDER CHARACTERIZED BY
INVOLUNTARY MOVEMENTS (CHORA), GENERAL MOTOR IMPRINENT,
PSYCHIATRIC DISORDERS AND DEMENTIA. ONSET OF THE DISBASE OCCURS
USUALLY IN THE THIRD ON FOURTH DECADE OF LIFE AND SYMPTOMS
ROGGRESSIVELY WORSEN LEADING TO DEATH IN 10 TO 20 YEARS. IT
AFFECTS I IN 10,000 INDIVIDUALS OF EUROPEAN ORIGIN. NEUROPATHOLOGY
OF HUNTINGTON'S DISEASE DISPLAYS A DISTINCTIVE PATTERN WITH LOSS
OF HUNTINGTON'S SPECIALLY IN THE CAUDATE AND PUTAMEN (STRIATUM).

MEDLINE; 91300466.

J. CELL BIOL. 114:241-253(1991).

C. SKELETAL ELEMENTS; THEY BIND TO THE ENTHROCYTE MEMBRANE PROTEIN GP85, AND TO THE CYTOSKELETAL PROTEINS FODRIN, TUBULIN, VIMENTIN AND BAND 4.2, TO NA.* ATPASE, TO THE LEMPHOCYTE MEMBRANE PROTEIN GP85, AND TO THE CYTOSKELETAL PROTEINS FODRIN, TUBULIN, VIMENTIN AND CONTROL SPECIFICITY: PLASMA MEMBRANE OF INCOURTE AND EXCHANGE PROTEIN; THEY RETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.

THEY RETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.

THEY RETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.

THEY RETAIN WOST OR ALL OF THESE BINDING FUNCTIONS.

THEY PROJUCTIVE PRODUCTS: THE TWO BRAIN VARIANTS AS WELL AS GLIAL CELLS THROUGHOUT THE BRAIN.

THEY PROSPHORYLATED AT WULTPLE SITES BY DIFFERENT PROTEIN'S STRUCTURE AND FUNCTION (POTENTIAL).

THEY SHILLS THE CONTAINS 24 ANK REPEATS.

THERNATIVE PRODUCTS: THE TWO BRAIN VARIANTS ARE PRODUCED BY ALTERNATIVE SPLICING OF GENE ANK2.

THEY STAYS 3443; 344633.

This sequence represents the 01 mutant of the Drosophila melanogaster
"timeless" (IIM) protein. The TIMO1 mutant is an arrhythmic mutation. TIM
is a nuclear translocation protein (NTP) of the invention. The NTPs of
the invention have specific binding activity to a protein involved in
circadian rhythms, and cyclic transcription patterns related to the
sleep-wake cycle. The NTP is also preferably light sensitive, and has a
stabilising effect on the circadian rhythm protein. The NTP also has the
ability to aid the process of circadian rhythm entrainment to
environmental cycles of light. TIM has specific binding activity for the
Drosophila period (PER) gene. PER is a nuclear protein which has homology
                                                                      TIMOI mutant protein.

TIMO: timeless protein, nuclear translocation protein; circadian rhythm; sleep-wake cycle; light sensitive; environmental cycle; nuclear protein; brosophila period gene; transcription factor; PAS domain; depression; narcolepsy; PER; jet lag; NTP; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nuclear translocation protein which binds to protein involved in circadian rhythms - used to develop prods. for diagnosis, prevention or treatment of disorders associated with circadian rhythms, e.g. jetlag and narcolepsy

This sequence represents the Drosophila melanogaster "timeless" (TIM) protein. TIM is a nuclear translocation protein (NTP) of the invention. The NTPs of the invention have specific binding activity to a protein involved in circadian rhythms, and cyclic transcription patterns related to the sleep-wake cycle. The NTP is also preferably light sensitive, and has a stabilising effect on the circadian rhythm protein. The NTP also has the ability to aid the process of circadian rhythm entrainment to environmental cycles of light. TIM has specific binding activity for the Drosophila period (PER) gene. PER is a nuclear protein which has homology to the family of transcription factors containing the PSS domain, and is
                 a protein involved in circadian rhythms, but the biological function of bern sunnown. The amount of PER fluctuates with a circadian rhythm, and the protein is also phosphorylated with a circadian rhythm. The NTPS of the invention, their fragments, agonists, mimics and antagonists are useful for preventing and/or treating disorders of a circadian rhythm expension, narcolepsy or jet lag. The products can also be used for detecting and/or measuring conditions so as to classify groups of individuals with the disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      such as depression, narcolepsy or jet lag. The products can also be used for detecting and/or measuring conditions so as to classify groups of individuals with the disorders.

Assaying collagen fragments in body fluid by immunoassay - using antibodies raised against synthetic peptide(s) contg. potential richardism, e.g. osteoporosis.

Translinking sites, to diagnose and monitor disorders of collagen metabolism, e.g. osteoporosis.

Disclosure (Appendix A); Page 49; 87pp; English.

Determination of collagen fragments in body fluids can be achieved by immunoassay using antibodies directed against synthetic peptides derived from collagen which contain sites of potential crosslinking. The method is used to diagnose and monitor treatment of disorders of collagen metabolism (degredation of type I collagen may indicate osteoporosis, metastatic progression, Paget's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure, Ftq 2; 133pp; English.

The sequences given in R44430-32 are encoded by the eryA fragment of the sequences given in R44430-32 are encoded by the eryA fragment of the Saccarapolyspora erythraea genome. These polypeptides are involved in the biosynthesis of the polyketide segment of erythromycin. EryA is organised in modules and each module takes care of one condensation step. The precise succession of elongation steps is dictated by the genetic order of the modules. The DNA encoding these polypeptides may be specifically altered such that novel polyketide molecules of desired structure are produced. Three types of alteration may be produced; those inactivating a single function in a module which does not arrest acyl chain growth; those inactivating a single function in a module which does affect chain growth; and those affecting an entire module. The mutations may be introduced by gene

Determination of collagen fragments in body fluids can be achieved by immunoassay using antibodies directed against synthetic peptides derived from collagen which contain sites of potential crosslinking. The method is used to diagnose and monitor treatment of disorders of collagen metabolism (degredation of type I collagen may indicate costeoporosis, metastatic progression, Paget's disease, hyperthytoidism or other conditions involving excessive bone resorption; degredation of type II collagen may indicate rheumatoid arthritis or osteoarthritis; and of type III collagen, vaculitis syndrome). The method can also be used to assess the toxicity of a compound and to test drugs for their effect on collagen metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Restoring contact inhibition to hyperproliferative cells - by introducing nucleic acid encoding ElA peptide, also promoting differentiation, used for treating malignancies
Disclosure; Page 20-22; 41pp; English.
This sequence is encoded by the product of alternative splicing of the ElA RNA such that the information contained within this sequence is a subset of the larger ElA protein, see also R52602. ElA is an adenovirus early gene and produces two products. The 243 and 289 residue proteins are both transcriptional regulation proteins which facilitate the oncogenic transformation of certain rodent cells by other oncogenes. The adenovirus ElA gene unexpectedly influences the phenotype of human turnour cells so as to restore their contact inhibitory properties and promote differentiation. Stable-expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of the adenovirus 5 ElA gene reduces anchorage-independant growth and tumorigenic potential, promotes reorganisation, induces flat morphology, and restores contact inhibition in human tumour cell lines. Therefore ElA acts as a tumour suppressor gene in this human
                                                                                                                                                                                                                                        Cartiage matrix. It is composed of a tightly wound triple helix which can only be cleaved by the metalloproteinase collagenase to produce 3/4 and 1/4 length alpha chain fragments. The destruction of articular cartilage is due, in part, to the degradation of collagen. Incapable of maintaining its helical structure at physiological temperatures, collagenase-cleaved collagens unwind and become susceptible to further degradation by other proteinases. By producing monoclonal artibodies directed against epitopes which are means of determining the degredation of cartilage in a biological sample. The antibodies do not bind to native helical collagen. R59749, R5750 and R67742.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Human adrenoleucodystrophy wild-type protein ALDp.
Adrenoleucodystrophy; gene therapy; retroviral vector M48;
adrenomyelopathy; membrane protein; long chain fatty acid oxidation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant viral vector contg. DNA for correcting adrenoleuco-dystrophy - and immunologically tolerable cells contg. this vector, useful in gene therapy
Example; Fig 7; 36pp; French.
A 2.43 kb Spel-EcoRI fragment of human wild-type ALD
(adrenoleucodystrophy) CDNA was inserted into retroviral vector M48 (adrenoleucodystrophy) CDNA was inserted into retroviral vector M65 so that it was under control of the mouse phosphoglycerate kinase (PGK) promoter. The resulting vector was co-transfected with vector PGK-neomycin into amphotropic packaging cell line psiGRIP. Neomycin (G418)-resistant transfected cells which were also positive with anti-ALD antibodies were incubated with skin fibroblasts of an ALD patient. After two rounds of infection, about 70% of cells were
                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N=PSDB; 094048.

New nucleic acid responsible for adreno-leuco-dystrophy - related probes, proteins and antibodies, useful for diagnosis and treatment Claim 16; Fig.2A-B; 39pp; English.

Probes corresp. to breakpoints in the red pigment gene of an AMN patient were used to isolate clones from an Xq28 cosmid library.
Following hybridizations and nested PCR, a HeLa cell cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expressing normal ALD protein (ALDp) and integration of M48-ALD was confirmed by Southern blotting. The present sequence is that of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NADPH oxidase derived from plants - useful for control of growth of transformed plants and for evaluation of agricultural chemicals claim 1; Pages 7-9; Ilpp; Japanese.

The presents sequence represents a NADPH oxidase. The CDNA encoding this protein sequence was isolated from a CDNA library of Arabidopsis thalians. The NADPH DNA and protein can be used in the development of agricultural chemicals. They allow for the control of growth of transformed plants for smooth evaluation of agricultural chemicals.
was screened, and a complete ALD cDNA fragment (Q94048) encoding the protein given in R94048 was obtd. Transformation of hematopoietic cells with ALD-encoding sequences in vivo will allow therapy of ALD

HIV related human retro-virus strain -

Todd. of antibodies for assays

Claim 9; Fig 4; 28pp; English.

A sequence is degenerate thereof are claimed.

HIV-2 SBL/ISY or a part thereof, or a degenerate thereof are claimed.

HIV-2 SBL/ISY or a part thereof, english.

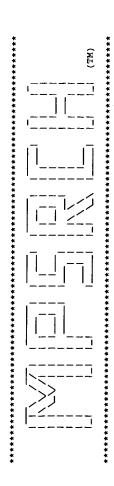

Constructed from DNA of HUT-78 cells infected with SBL-6669 85 using the lambda-phage vector EMBL-3. SBL-6669 85 was isolated from lymphocytes of a West African woman. Protection is requested for the entire genome disclosed in m89890 and for parts thereof, and corresp. to various genes corresp. As sequences and parts thereof and various products derived therefrom, or use thereof, such as clones prepd. by recombinant vector method, HIV test devices and methods. X corresponds to the translation of a stop codon.
                                                                       ö

New immunogenic regions of Papilloma virus 16 E7 protein - useful in vaccines and for diagnosis, and new derived antibodies Example 2; Page 3; 3pp; German.

Example 2; Page 3; 3pp; German.

The sequence extends downstream from nucleotide 667 of a HPV16 DNA capression bank. HPV16 DNA fragments of ca. 100 bp were blunt-end ligated into PvuII-cleaved phage vector fd-tet-J6. Recombinant compages were plated on E. coli K91 and replicated on nitrocellulose membranes probed with specific sera. 200 recombinants reacted and 30 of them were sequenced. This sequence was identified from 5 are useful in vaccines, to detect specific antibodies against HPV16 E7-protein. Antibodies are also useful diagnostically. Sequence 17 AA;
                                                                                                                                                                                                                                                                                                              ö

Sero-active epitope(s) of human papilloma-virus 16 proteins - for use vaccines and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     claim 4; Page 11; 15pp; English.

This is one of two seroreactive epitopes derived from the 107 region of HPV16 protein E7. Peptides containing this epitope are also claimed and can be used to generate antibodies to HPV. See R41287-R41287-R4168-214171.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

scale 0.975

Fukusho, A.; Yu, Y.; Yamaguchi, S.; Roy, P.
J. Gen. Virol. (1989) 70:1677-1689
Completion of the sequence of bluetongue virus serotype 10 by the characterization of a structural protein, VP6, and a non-structural protein, NS2.
                                                                                                                                                                                                                                                                                                                                                                                               Wade-Evans, A.M.; Mertens, P.P.C.; Belsham, G.J.
J. Gen. Virol. (1992) 73:3023-3026
Sequence of genome segment 9 of bluetongue virus (serctype 1, South Africa) and expression analysis demonstrating that different forms of VP6 are derived from initiation of Jobets of Synthesis at two distinct sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              minor inner core protein VP6 - bluetongue virus (serotype 10, American isolate)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                the nucleotide sequence was submitted to the EMBL Data
Library, June 1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hsia, R.; Bavoil, P.M.
Gene (1996) 176:163-169
Homologs of Escherichia coli recJ, gltx and of a putative
'early' gene of avian Chlamydia psittaci are located
upstream of the 'late' omp2 locus of Chlamydia psittaci
strain guinea pig inclusion conjunctivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              JC5208 *type complete

A STEINMANN B., SPRANGER J., ZABEL B.,

L. MED. GENET. 33:449-644(1996).

C. I- FUNCTION: COLLAGEN TYPE II IS SPECIFIC FOR CARTILAGINOUS TISSUES.

C. I- SUBUNT: TRIMERS OF IDENTICAL ALPHA 1(II) CHAINS.

UNIT (G-X Y) ARE HYDROXILATED IN SOME OR ALL OF THE CHAINS.

C. I- DISEASE: DEFECTS IN COLLAI ARE THE CAUSE OF A VARIETY OF THE CHAINS.

C. I- DISEASE: DEFECTS IN COLLAI ARE THE CAUSE OF SPONDYLOEPIPHYSEAL DYSPLASIA, CONGENITAL TYPE (SEDC); A DISORDER CHARACTERIZED BY DISPROPORTIONATE SHORT STATURE AND PLEIOTROPIC INVOLVEMENT OF THE SKELTAL AND OCULAR SYSTEMS.

C. I- DISEASE: DEFECTS IN COLLAI ARE THE CAUSE OF TYPE II WAGNER SYNDROME (WS-II); A DISEASE CHARACTERIZED BY THE SYNDROME (WS-II); A DISEASE CHARACTERIZED BY EARLY-ONSET CATARACTS, LATITICE DEGENERATION OF THE RETINA, AND RETINAL DESTANDED HYDOLOGIAR TISSUES.

C. I- DISEASE: DEFECTS IN COLLAI ARE THE CAUSE OF TYPE II ACHOUNDROGENESIS: A DISEASE CHARACTERIZED BY THE ACHOUNDROGENESIS; A DISEASE CHARACTERIZED BY THE ACHOUND ACHOUNDROGENESIS; A DISEASE CHARACTERIZED BY THE ACHOUND 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GENES DEV. 4:1688-1700(1990).

-1- FUNCTION: MAY HAVE A REGULATORY FUNCTION POSSIBLY IN ASSOCIATION WITH THE N GENE PRODUCT.

-1- SUBCELLULAR LOCATION: NUCLEAR.

-1- DEVELOPMENTAL STAGE: DURING EARLY NEUROGENESIS MAM PRODUCTS ARE UBIQUITOUSLY LOCATED. DURING LATER STAGES THEY ACCUMULATE IN THE CENTRAL NERVOUS SYSTEM.

-1- THE PROTEIN HAS MANY AS HOMOPOLYMERIC DOMAINS: 21 POLY-GIN RUNS (FROM 5 TO 16 AA IN LENGTH), 4 FOLY-GLY (6 TO 10 AA), 3 POLY-ASN (3 X 5 AA), 1 POLY-AIA (10 AA) AND 1 POLY-THR (5 AA) RUNS.

-1- SIMILARITY: TO OTHER NUCLEAR PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Mean 20.459; Variance 23.634; scale 0.866 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
